# Digital Image Processing (CSE/ECE 478)

## Lecture-8: Bilateral Filtering, Linearity Intro to Frequency Domain Processing

Ravi Kiran and Sudipta Banerjee

Center for Visual Information Technology (CVIT), IIIT Hyderabad

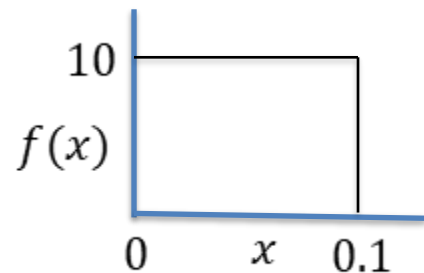

# Announcements

- MQ2: Points will be awarded to students who “attempted” qs: To represent 95% of the area within the Gaussian distribution, which of the following standard deviation values should be used?

# Recap

- PDF can be  $>1$ 
  - E.g., Uniform distribution  $U(0,0.1)$   $f(x) = K, 0 \leq x \leq 0.1$  and  $f(x) = 0, \text{elsewhere}$
  - $\int_{-\infty}^{\infty} f(x) dx = \int_0^{0.1} K \cdot dx = K \cdot x \Big|_0^{0.1} = 1$
  - $K = 10$

- Less consensus about Positive Laplacian (central element being positive vs. negative)

# Non-linear Spatial Filters (max)

pepper noise

**After applying max filter**

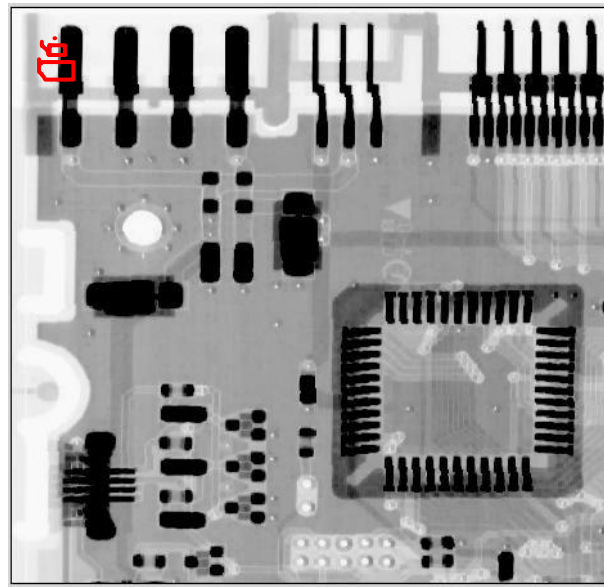

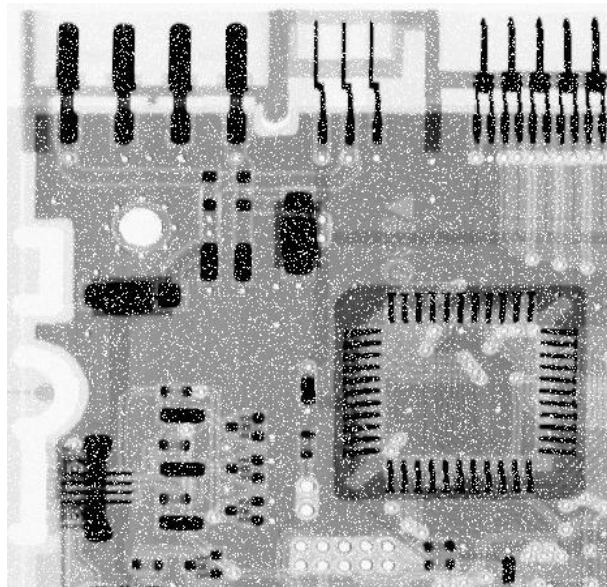

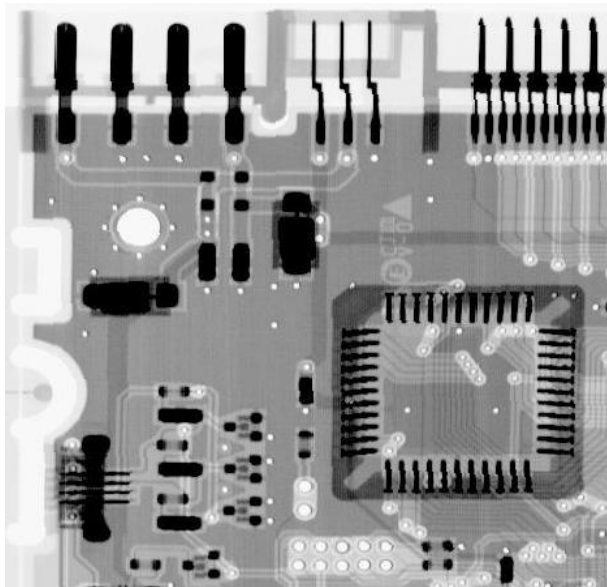

# Non-linear Spatial Filters (min)

5

salt noise

**After applying min filter**

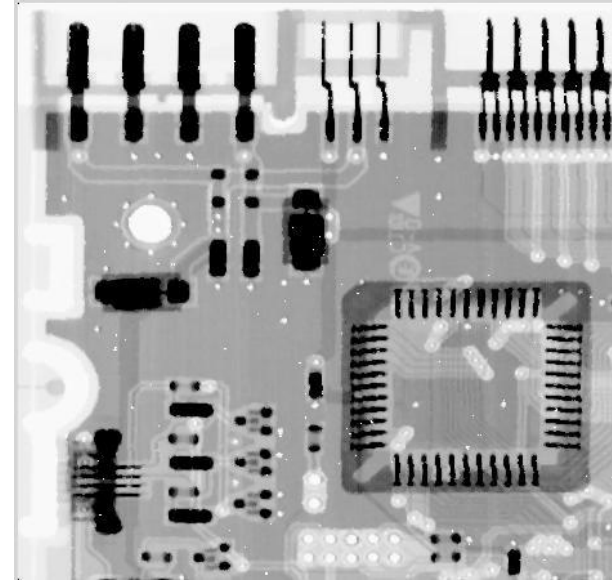

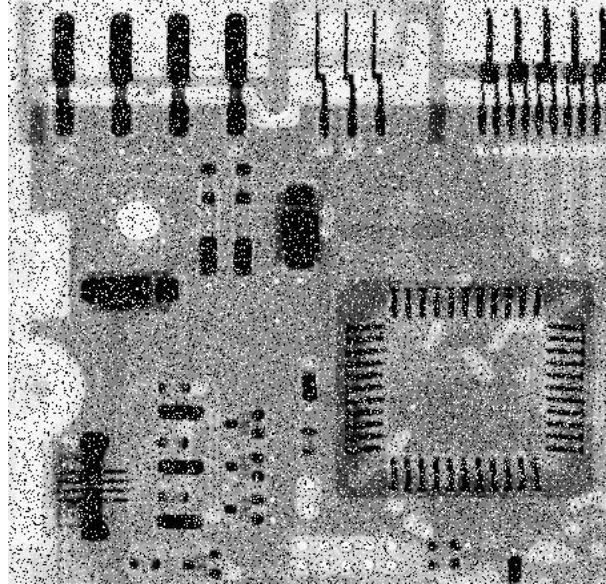

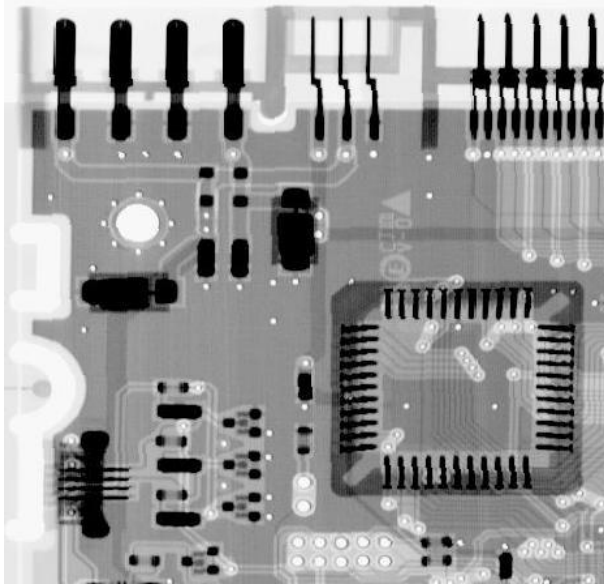

# Non-linear Spatial Filters (median)

6

salt & pepper noise

**After applying median filter**

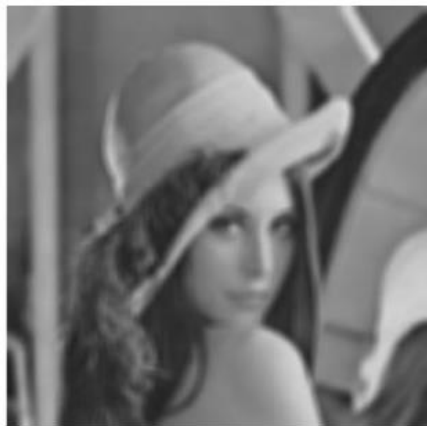

max, min, median  $\rightarrow$  also known as rank / order statistic filters

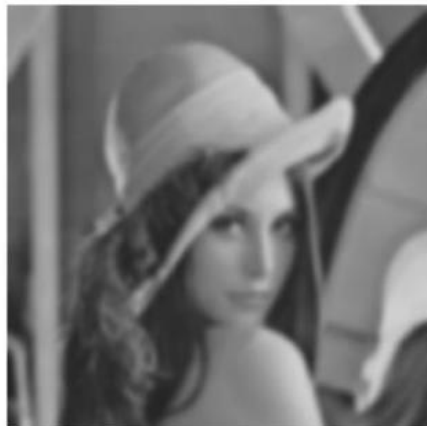

- ❑ Mean: blurs image, removes simple noise, no details are preserved
- ❑ Gaussian: blurs image, preserves details only for small  $\sigma$ .
- ❑ Median: preserves some details, good at removing strong noise

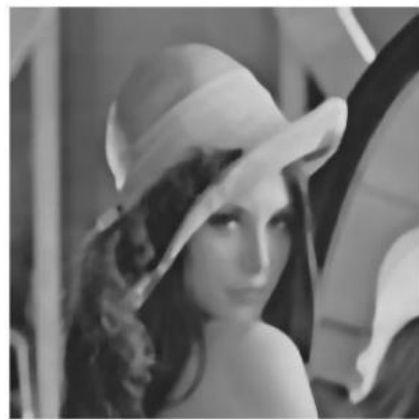

original

3x3 mean

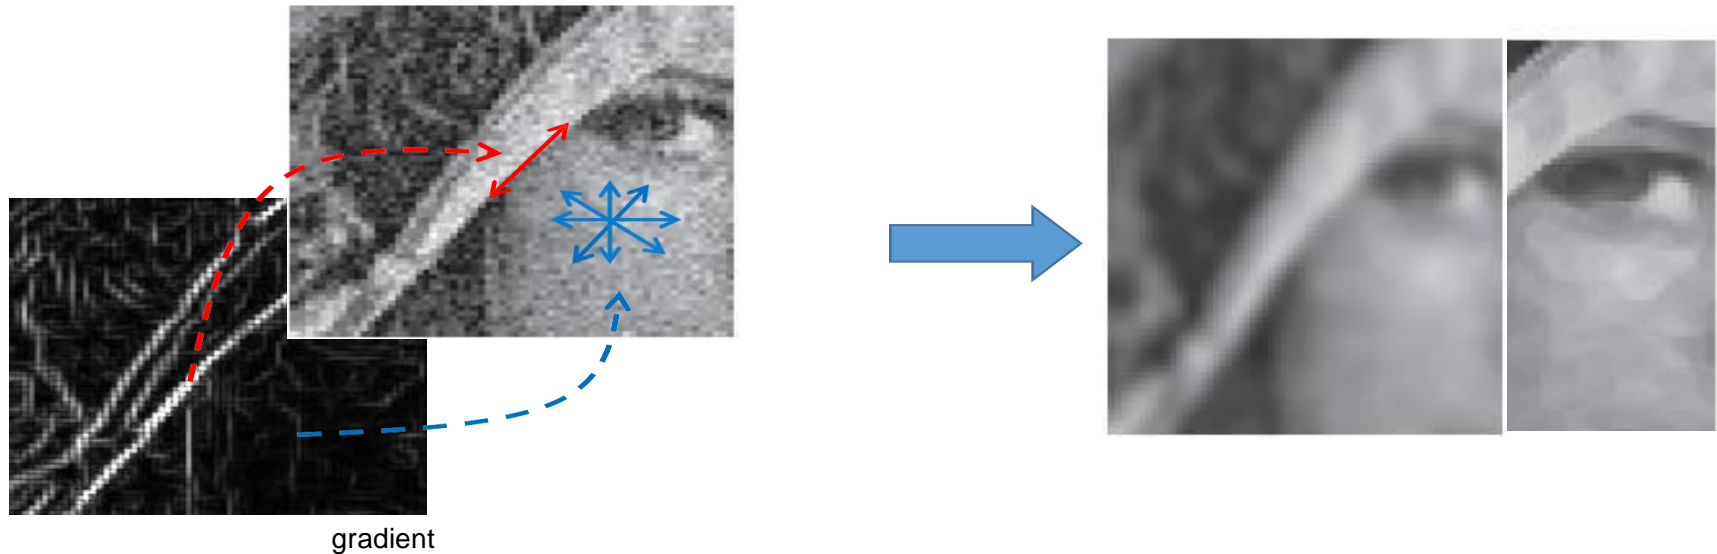

3x3 gaussian

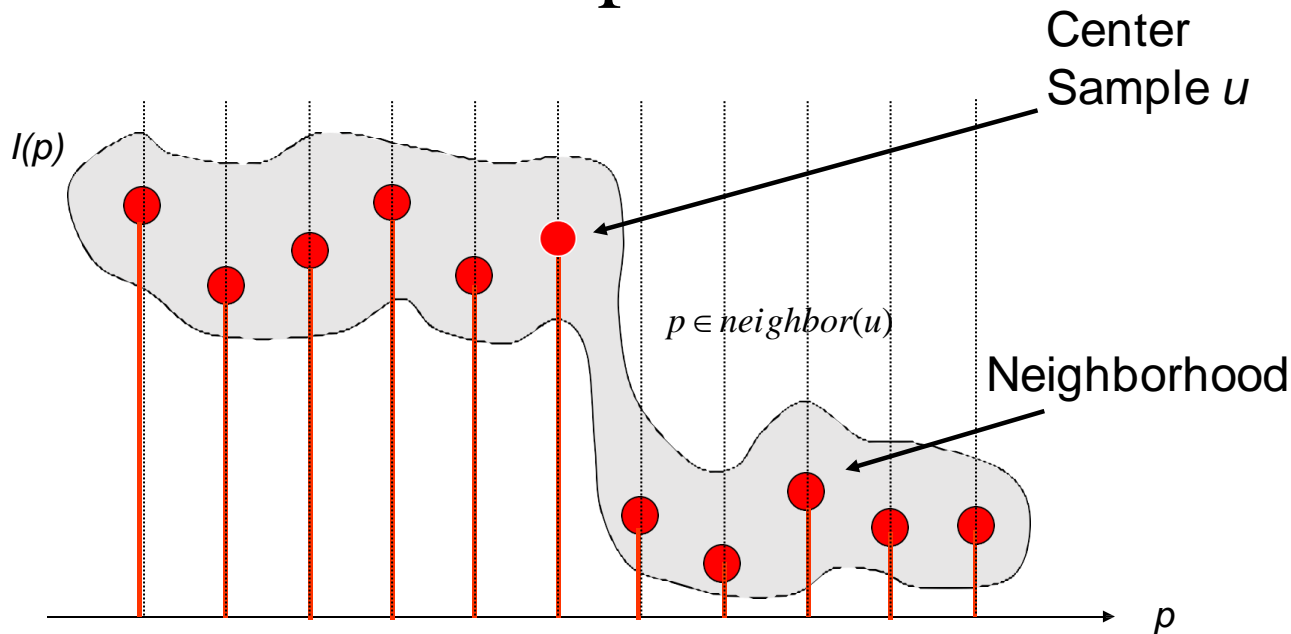

3x3 median

- **Edges**  $\Rightarrow$  smooth only along edges
- “Smooth” regions  $\Rightarrow$  smooth isotropically

# Bilateral Filters - 1D example

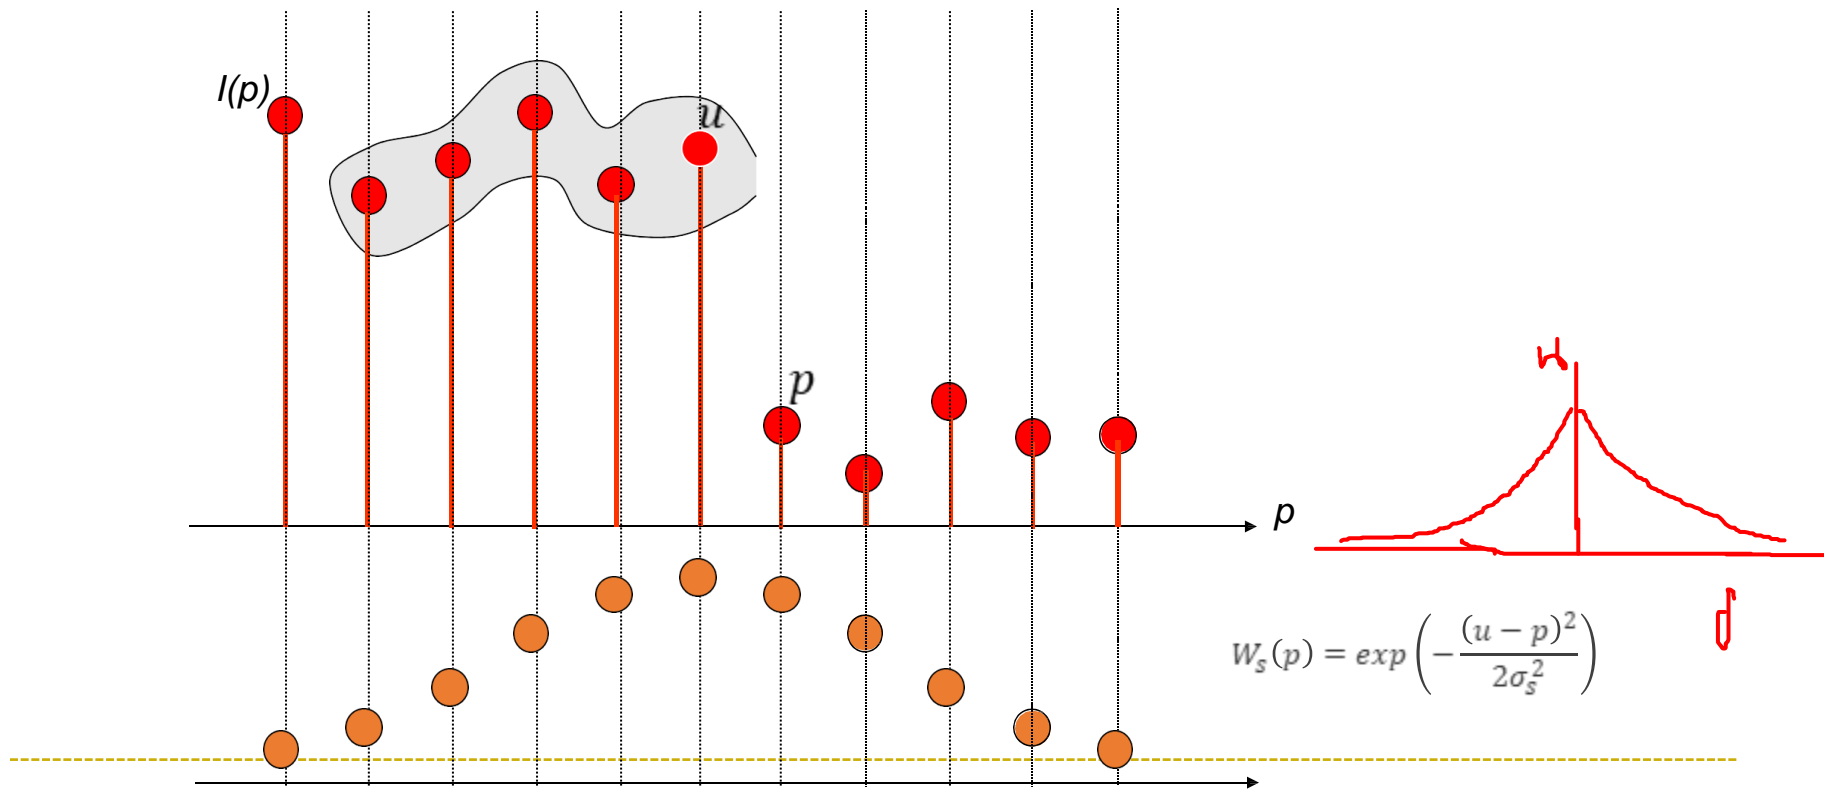

It is clear that in weighting this neighborhood,  
we would like to preserve the step

---

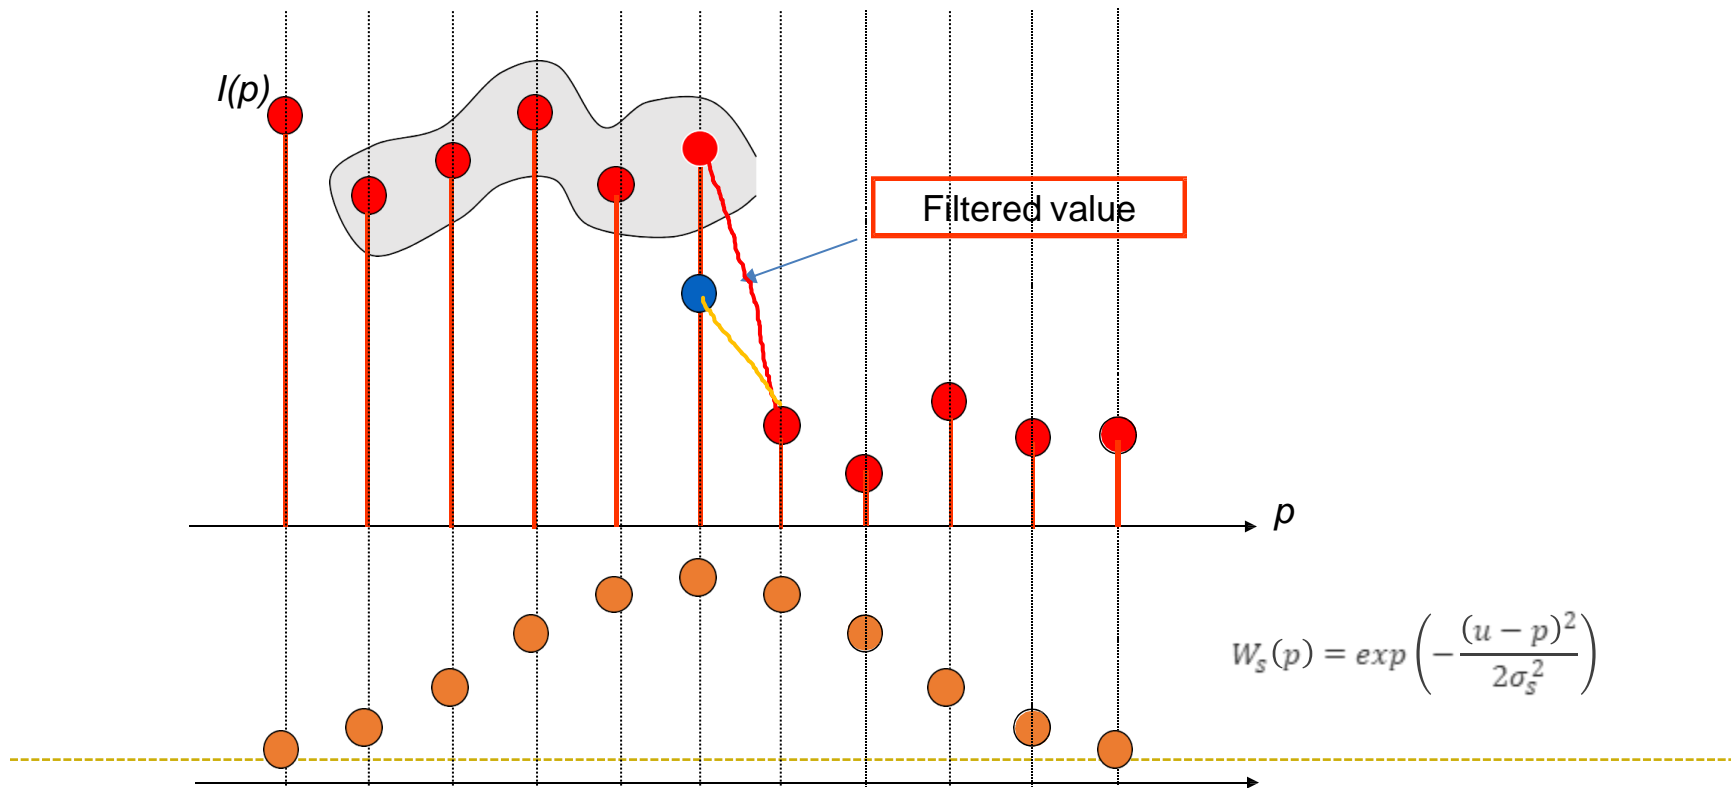

# Gaussian Weights

□ Gaussian Weights

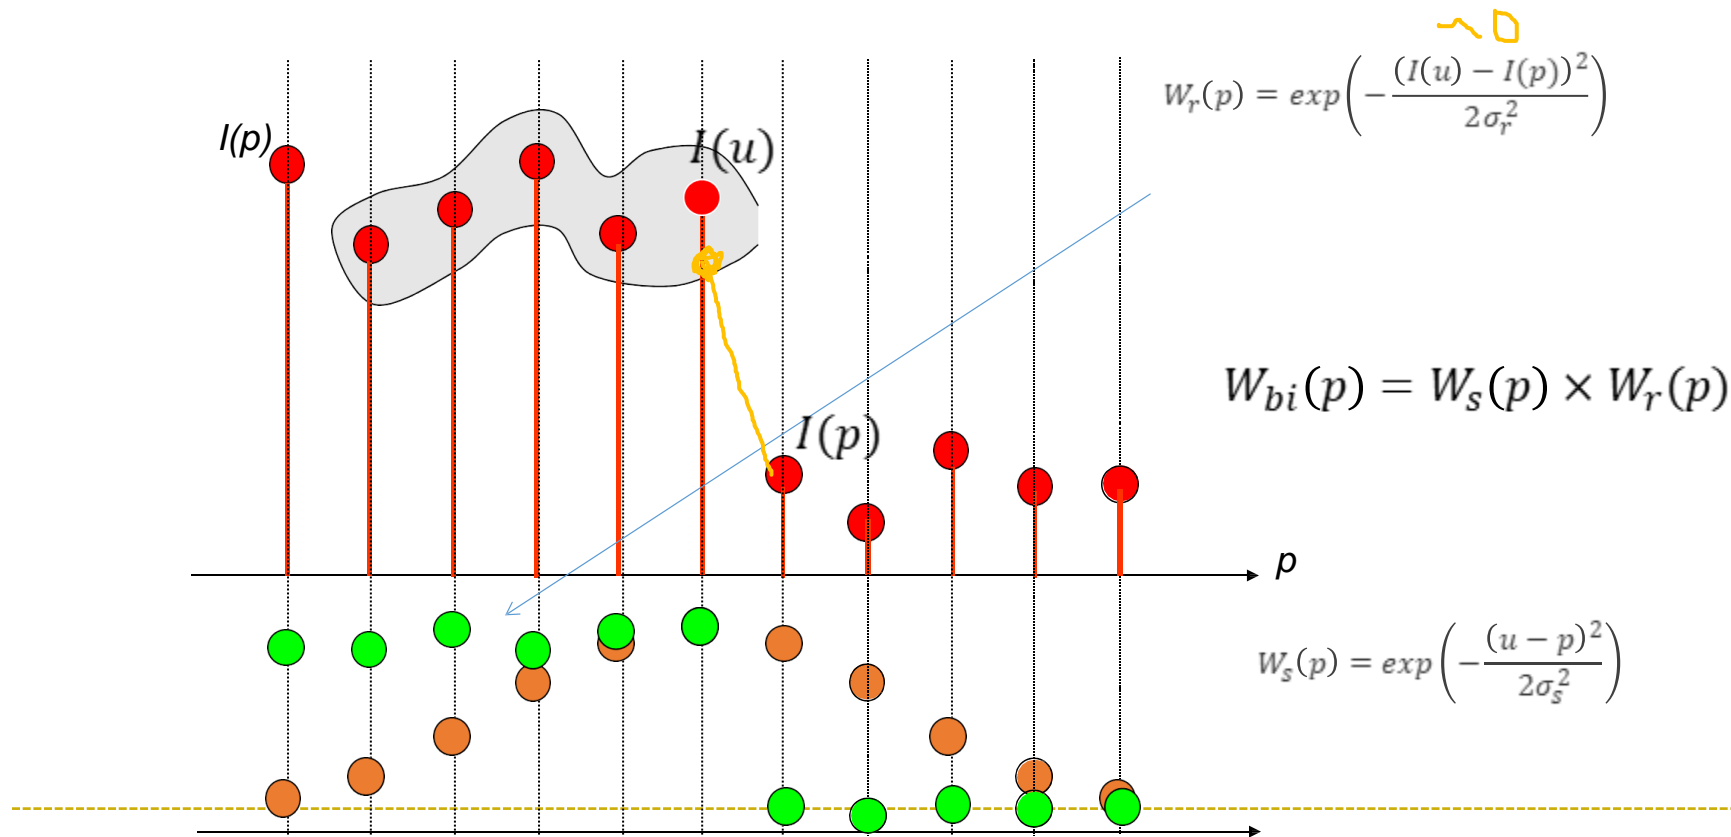

# Edge loss

□ Edge is smoothed/lost

# Photometric Weights

□ Introducing Photometric weights

- Filter Weights derived from both geometric and photometric distances

$$I'(u) = \frac{\sum_{p \in N(u)} e^{-\frac{\|u-p\|^2}{2\sigma_s^2}} e^{-\frac{|I(u)-I(p)|}{2\sigma_r^2}} I(p)}{\sum_{p \in N(u)} e^{-\frac{\|u-p\|^2}{2\sigma_s^2}} e^{-\frac{|I(u)-I(p)|}{2\sigma_r^2}}}$$

Diagram illustrating the components of the Bilateral Filtering equation:

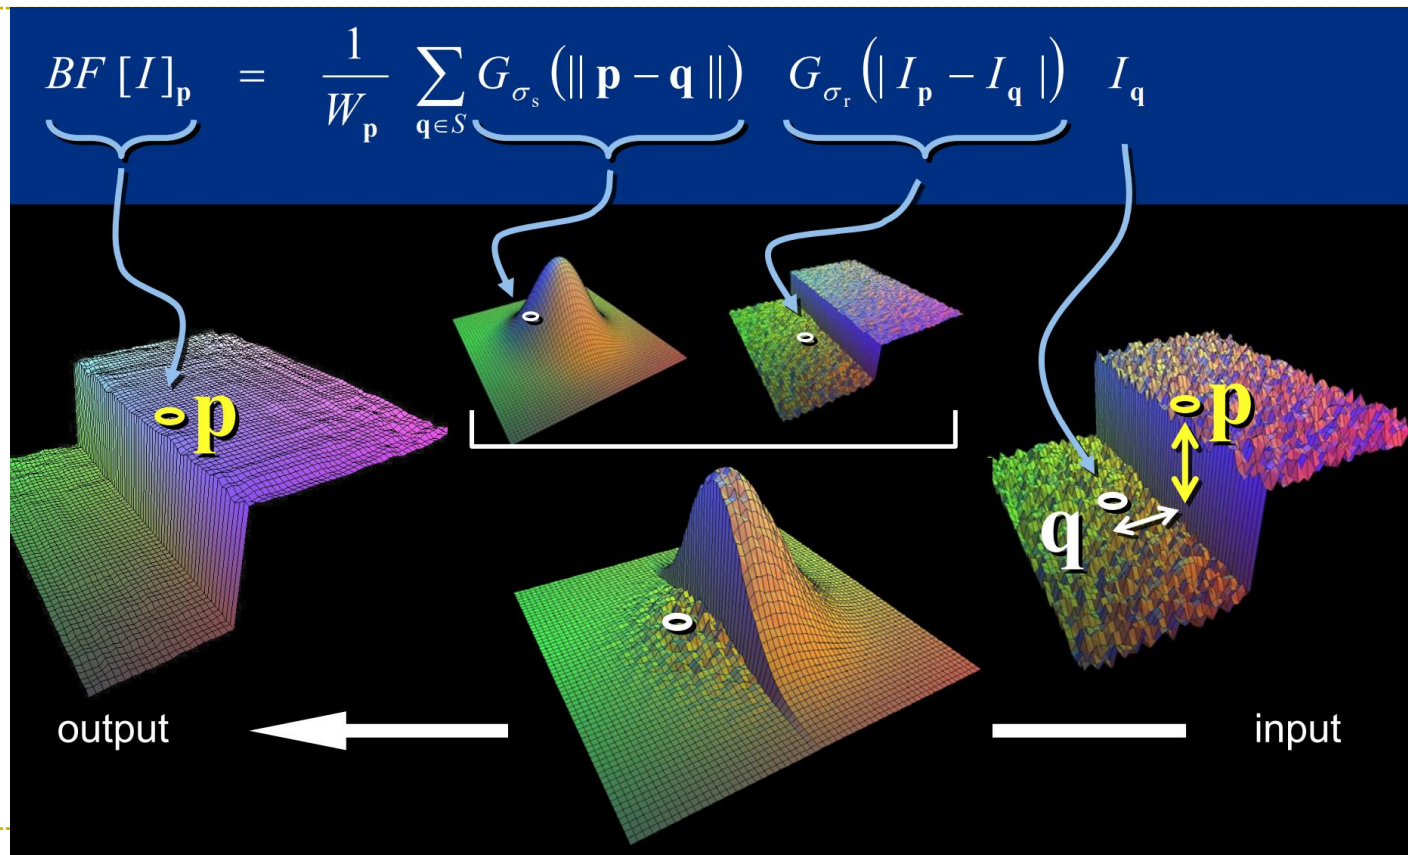

- Denoise**: Points to the spatial distance term  $e^{-\frac{\|u-p\|^2}{2\sigma_s^2}}$ .
- Edge preserving**: Points to the intensity difference term  $e^{-\frac{|I(u)-I(p)|}{2\sigma_r^2}}$ .
- Normalization**: Points to the denominator sum.

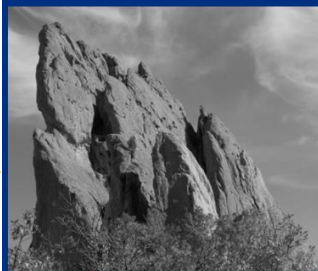

- ❑ Filter Weights derived from both geometric and photometric distances

$$BF[I]_p = \underbrace{\frac{1}{W_p}}_{\text{normalization}} \sum_{q \in S} \underbrace{G_{\sigma_s}(\|p - q\|)}_{\text{space}} \underbrace{G_{\sigma_r}(|I_p - I_q|)}_{\text{range}} I_q$$

## ❑ Illustration of bilateral filter changes

# Exploring the Parameter Space

input

$$\sigma_r = 0.1$$

$$\sigma_r = 0.25$$

$$\sigma_r = \infty$$

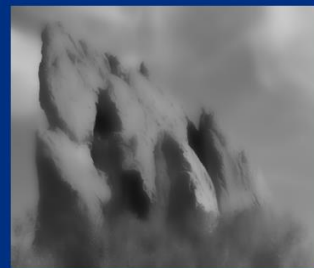

(Gaussian blur)

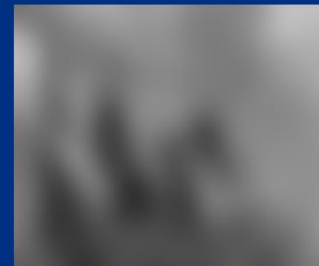

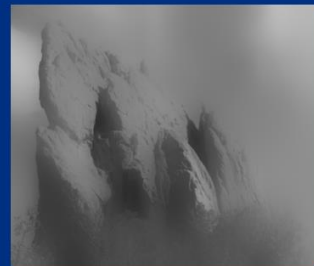

$$\sigma_s = 2$$

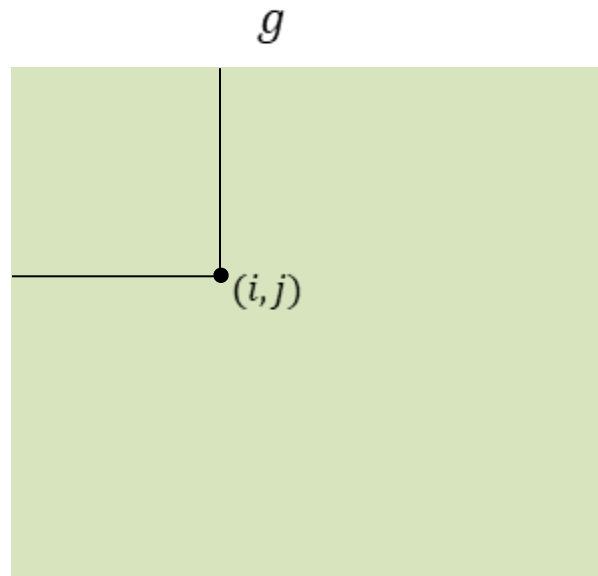

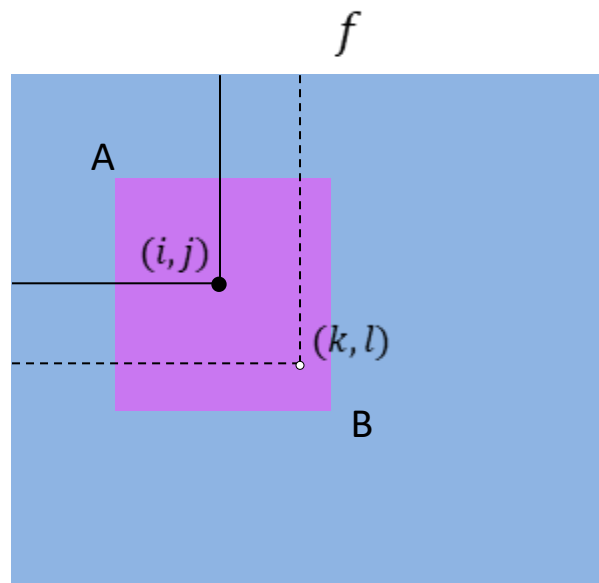

$$\sigma_s = 6$$

$$\sigma_s = 18$$

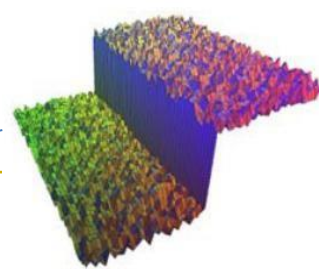

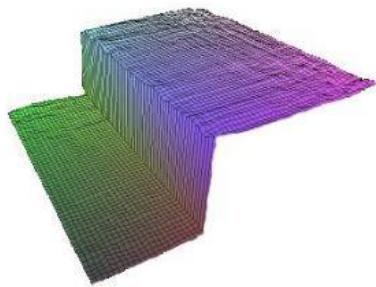

# Linear Spatial Filter

$$g(i,j) = \frac{\sum_{k,l} f(k,l)w(i,j,k,l)}{\sum_{k,l} w(i,j,k,l)}$$

	0	1	2	3	4
0	0.005	0.005	0.005	0.005	0.005
1	0.005	0.264	0.513	0.264	0.005
2	0.005	0.513	1.000	0.513	0.005
3	0.005	0.264	0.513	0.264	0.005
4	0.005	0.005	0.005	0.005	0.005

$$g(i, j) = \frac{\sum_{k,l} f(k, l) w(i, j, k, l)}{\sum_{k,l} w(i, j, k, l)}.$$

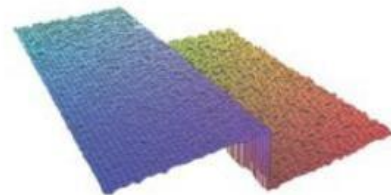

(3.34)

The weighting coefficient  $w(i, j, k, l)$  depends on the product of a *domain kernel* (Figure 3.19c),

$$d(i, j, k, l) = \exp \left( -\frac{(i - k)^2 + (j - l)^2}{2\sigma_d^2} \right), \quad (3.35)$$

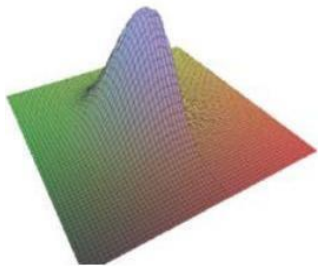

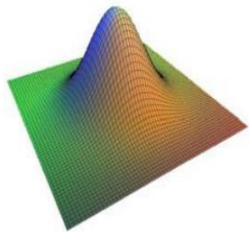

and a data-dependent *range kernel* (Figure 3.19d),

$$r(i, j, k, l) = \exp \left( -\frac{\|f(i, j) - f(k, l)\|^2}{2\sigma_r^2} \right).$$

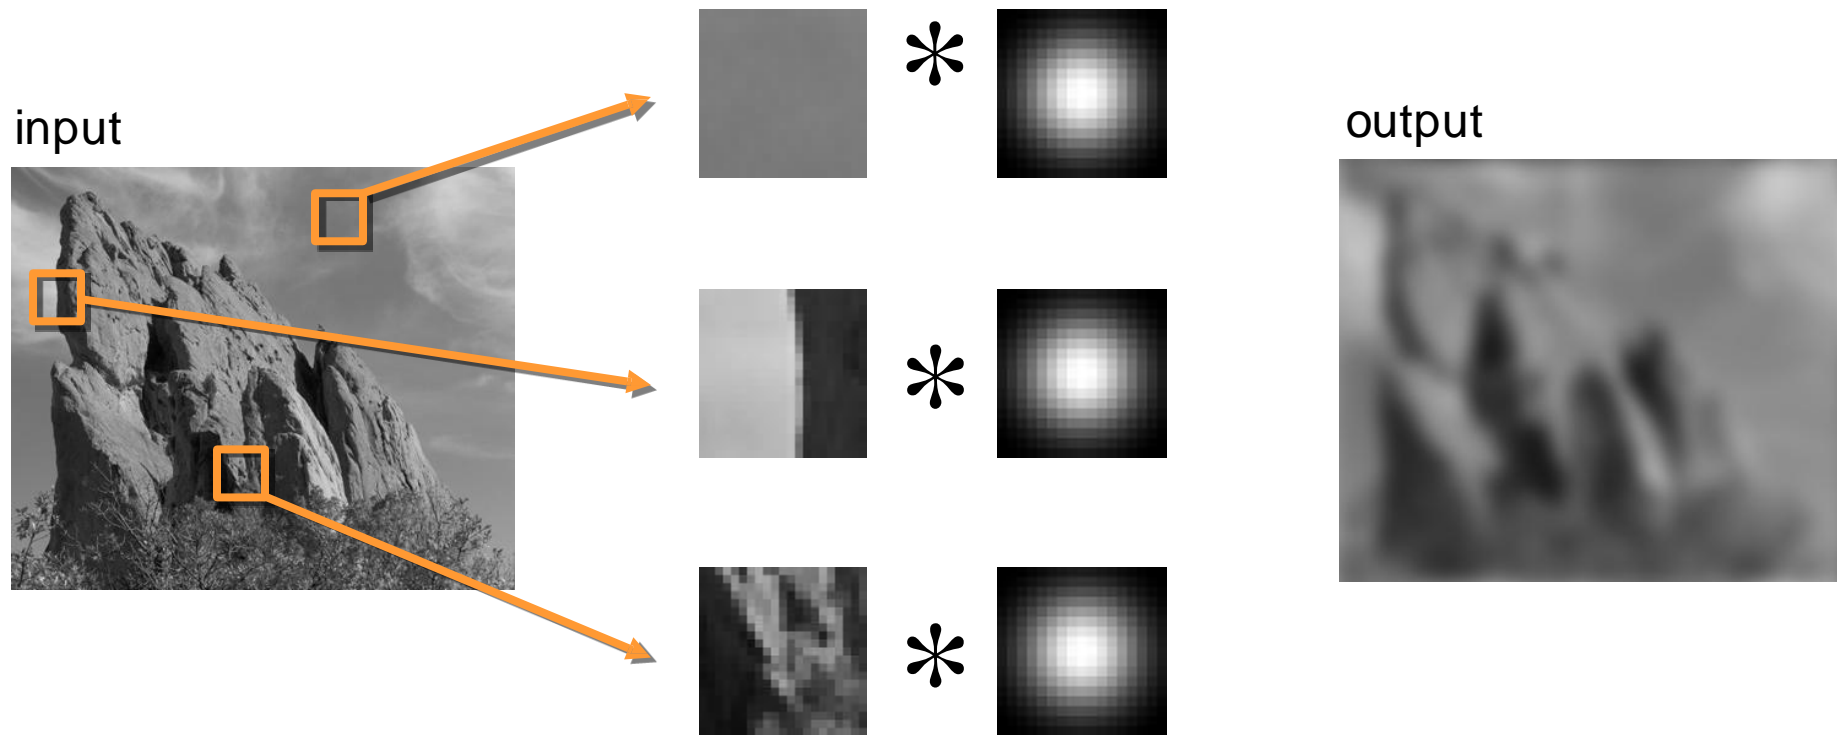

When multiplied together, these yield the data-dependent *bilateral weight function*

$$w(i, j, k, l) = \exp \left( -\frac{(i - k)^2 + (j - l)^2}{2\sigma_d^2} - \frac{\|f(i, j) - f(k, l)\|^2}{2\sigma_r^2} \right). \quad (3.37)$$

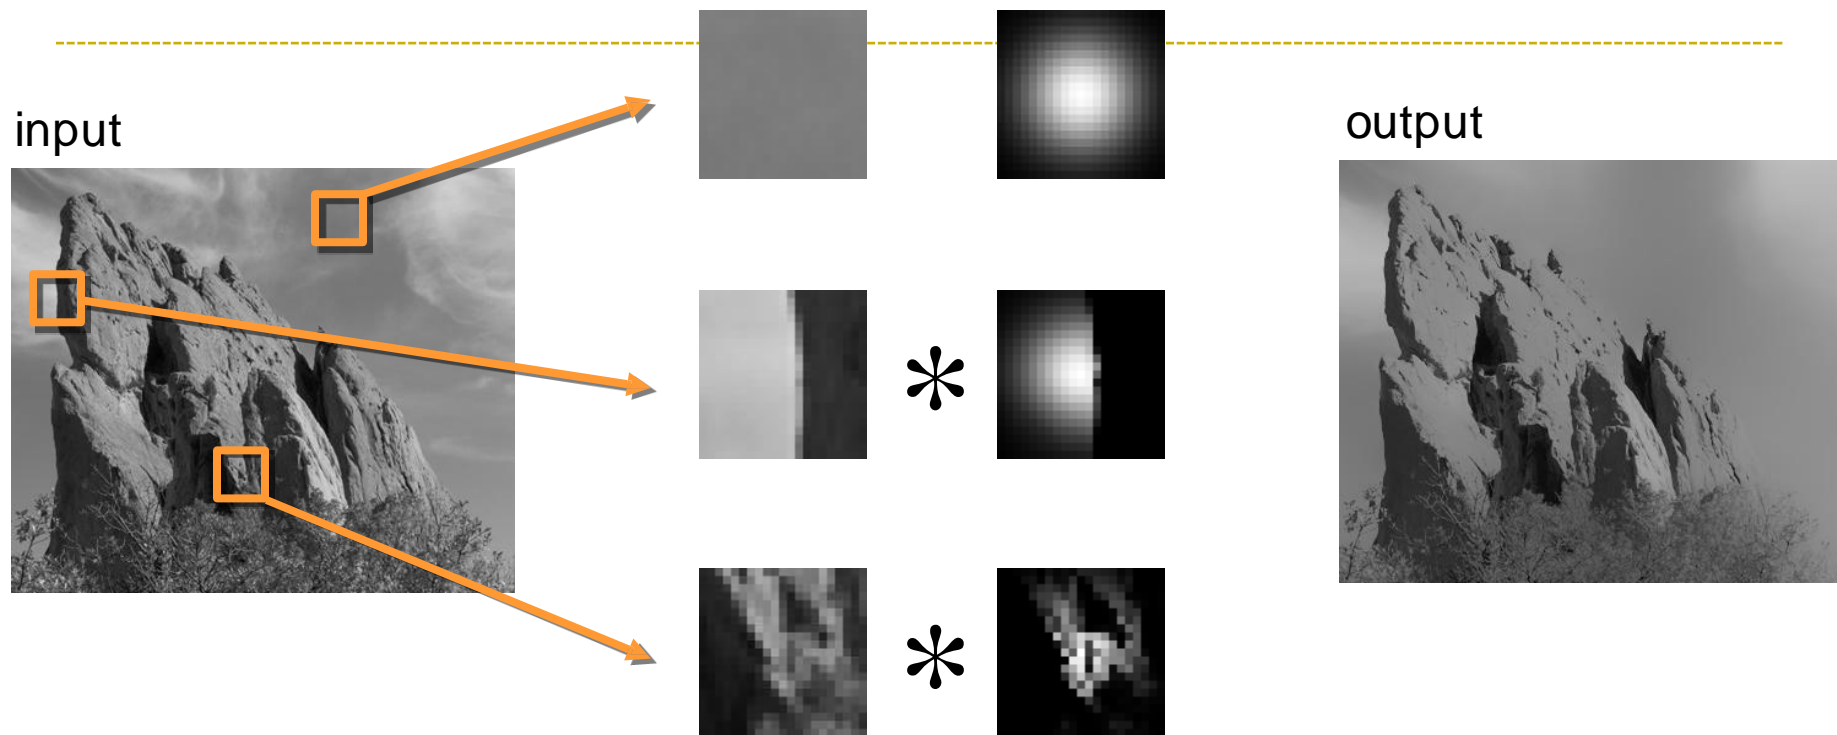

# Usual Gaussian Filtering

# Bilateral Filtering

The kernel shape depends on the image content.

# Iterating Bilateral Filter

$$I_{(n+1)} = BF[I_{(n)}]$$

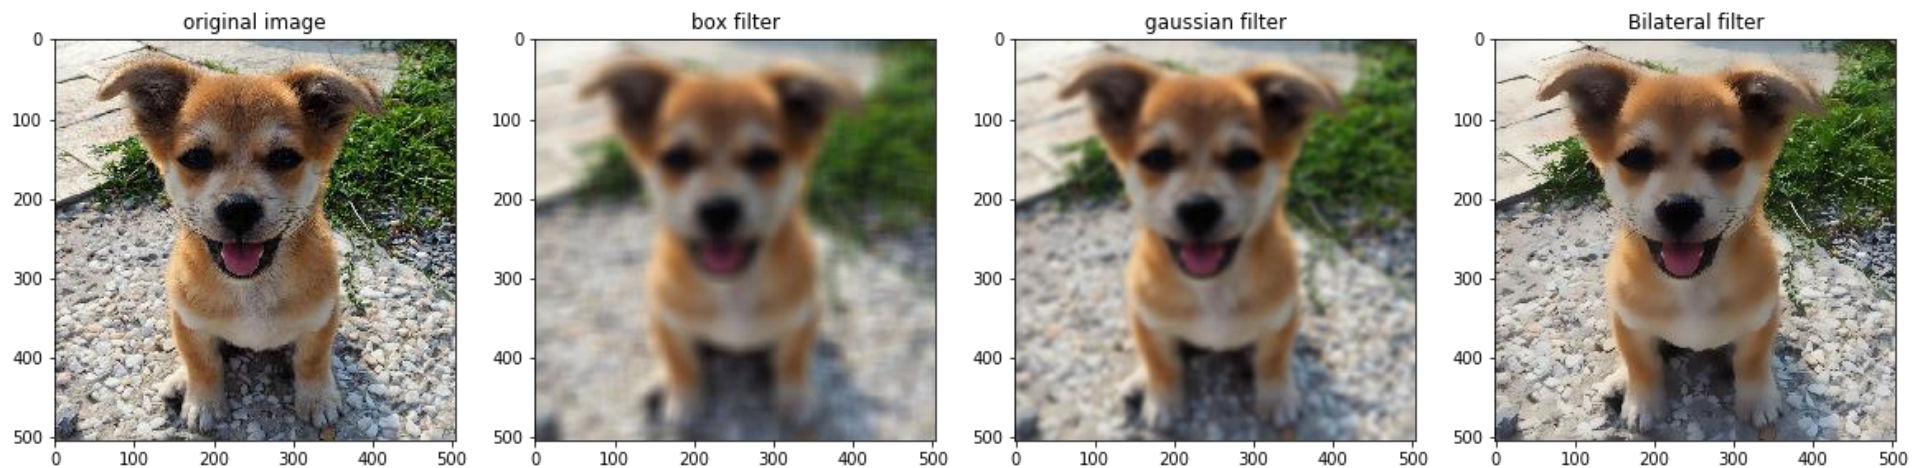

- Generate more piecewise-flat images
- Often not needed in computational photo.

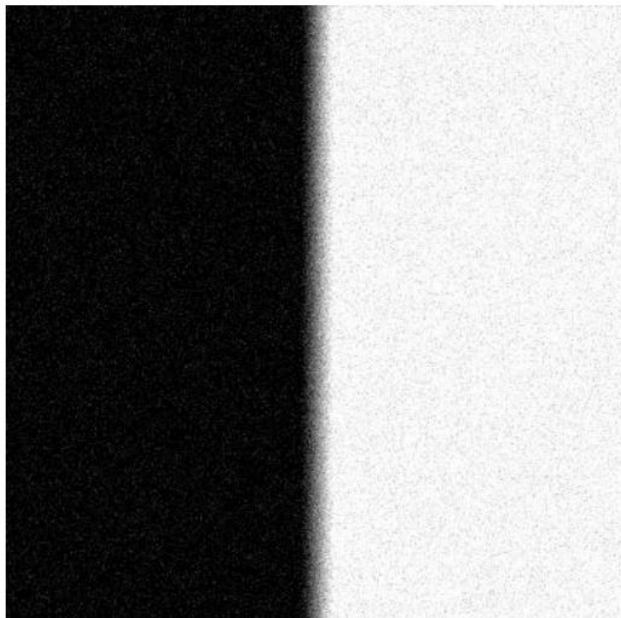

Fig. 2.4 Iterations: the bilateral filter can be applied iteratively, and the result progressively approximates a piecewise constant signal. This effect can help achieve a limited-palette, cartoon-like rendition of images [72]. Here,  $\sigma_s = 8$  and  $\sigma_r = 0.1$ .

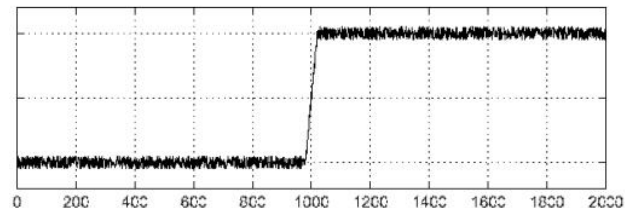

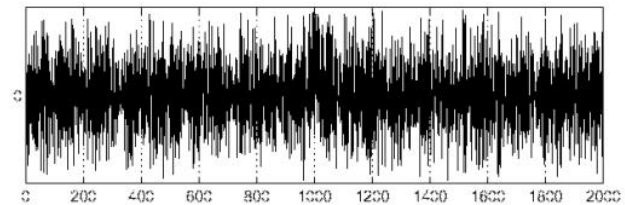

# Effect of noise on derivatives

Noisy image

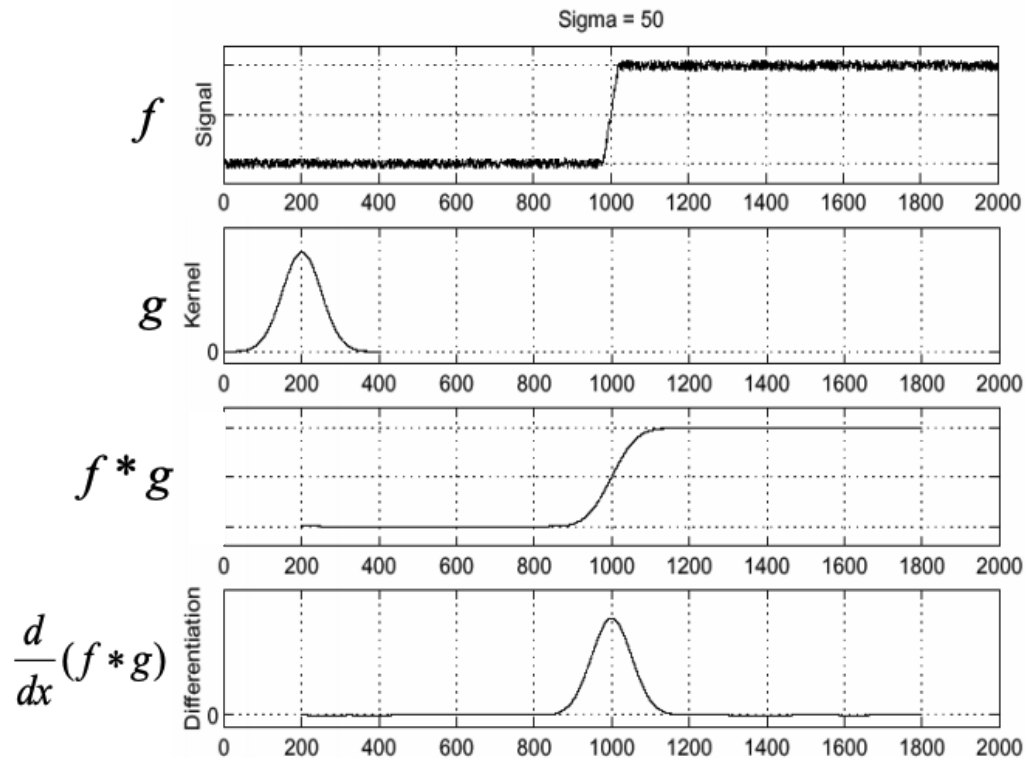

$$I[x, y = j]$$

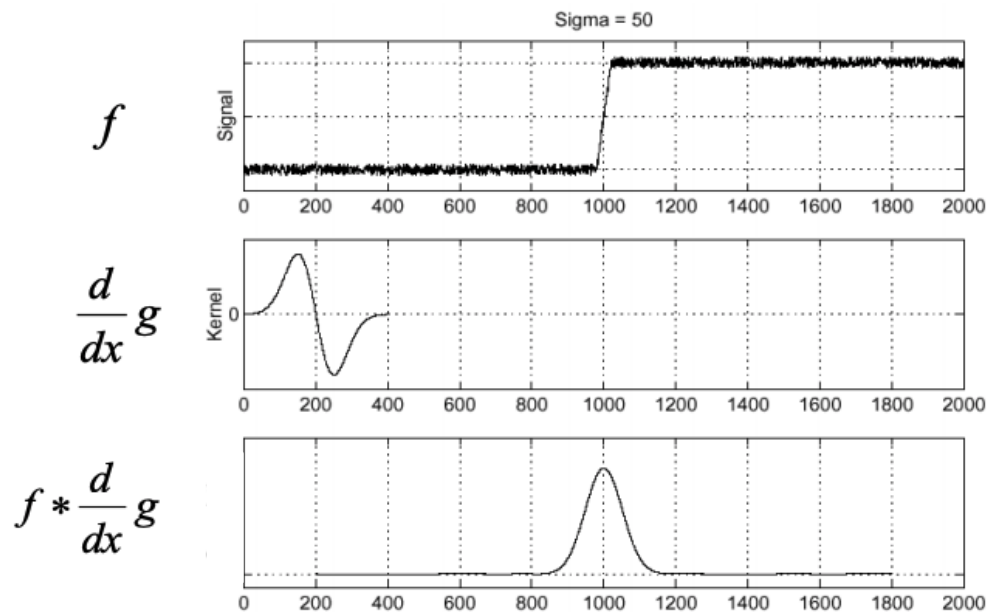

$$\frac{d}{dx} I[x, y = j]$$

# Solution: smooth first

$$\frac{d}{dx}(f * g) = f * \frac{d}{dx}g$$

- This saves us one operation:

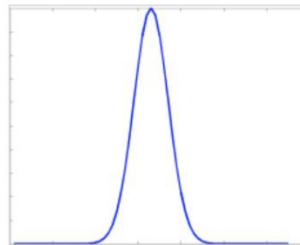

# Other Important Filters

- ▶ Laplacian of Gaussian
  - ▶ Noise Suppression

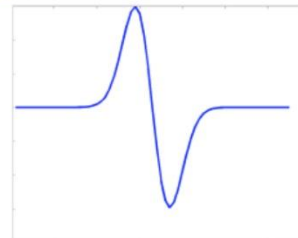

Robert Collins  
CSE486

## 1D Gaussian and Derivatives

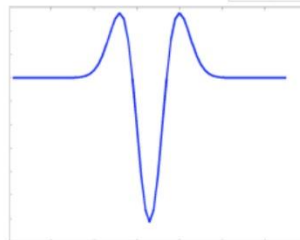

$$g(x) = e^{-\frac{x^2}{2\sigma^2}}$$

$$g'(x) = -\frac{1}{2\sigma^2} 2xe^{-\frac{x^2}{2\sigma^2}} = -\frac{x}{\sigma^2} e^{-\frac{x^2}{2\sigma^2}}$$

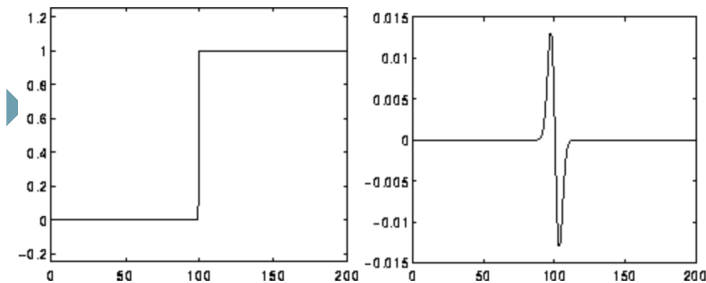

$$g''(x) = \left(\frac{x^2}{\sigma^4} - \frac{1}{\sigma^2}\right) e^{-\frac{x^2}{2\sigma^2}}$$

# Other Important Filters

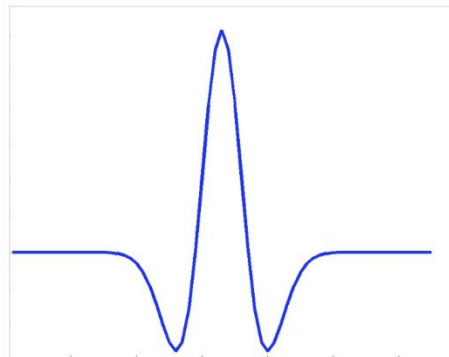

- ▶ Laplacian of Gaussian
  - ▶ Noise Suppression

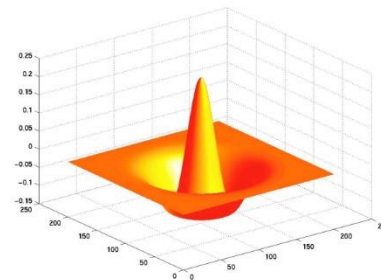

Robert Collins  
CSE486

## Second Derivative of a Gaussian

$$g''(x) = \left( \frac{x^2}{\sigma^4} - \frac{1}{\sigma^2} \right) e^{-\frac{x^2}{2\sigma^2}}$$

2D  
analog

LoG "Mexican Hat"

# Other Important Filters

- ▶ Laplacian of Gaussian
  - ▶ Noise Suppression
  
- ▶ Difference of Gaussian
  - ▶ Band-pass

Robert Collins  
CSE486

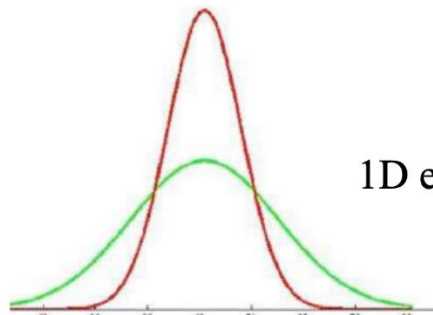

## Efficient Implementation Approximating LoG with DoG

LoG can be approximate by a Difference of two Gaussians (DoG) at different scales

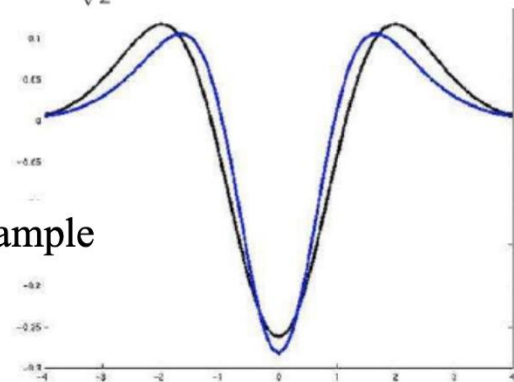

$$\nabla^2 G_\sigma \approx G_{\sigma_1} - G_{\sigma_2}$$

Best approximation when:

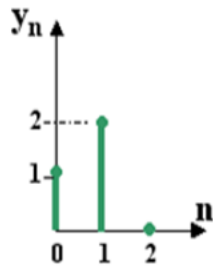

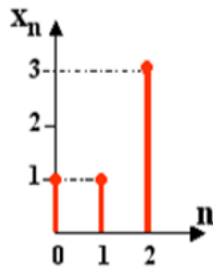

$$\sigma_1 = \frac{\sigma}{\sqrt{2}}, \sigma_2 = \sqrt{2}\sigma$$

1D example

# Linear System

A system  $T$  is **linear** if it satisfies the following two properties:

## 1) Scaling

$$x[n] \rightarrow \boxed{T} \rightarrow y[n] \Rightarrow \alpha x[n] \rightarrow \boxed{T} \rightarrow \alpha y[n]$$

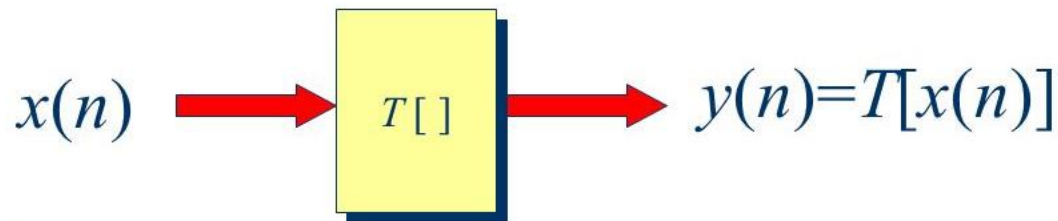

## 2) Additivity

$$\begin{aligned} x_1[n] &\rightarrow \boxed{T} \rightarrow y_1[n] & x_2[n] &\rightarrow \boxed{T} \rightarrow y_2[n] \\ \Rightarrow x_1[n] + x_2[n] &\rightarrow \boxed{T} \rightarrow y_1[n] + y_2[n] \end{aligned}$$

---

# 'Linear' Spatial Filtering

Linear System

$$T[ax_1(n) + bx_2(n)] = aT[x_1(n)] + bT[x_2(n)]$$

# Convolution / Linear Filters

- Smoothing (Average, Gaussian)
- Edge Filters (Prewitt, Sobel, Laplacian)

$$I'(u, v) \leftarrow \sum_{j=-1}^1 \sum_{i=-1}^1 I(u + i, v + j) \cdot H(i, j)$$

		j

# Convolution vs Cross-Correlation

- Cross-correlation: operation of sliding the kernel/filter across the image and computing SOP

$$H \circ I(x, y) = \sum_{i=-N}^N \sum_{j=-N}^N H(i, j) \cdot I(x + i, y + j) \quad \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$$

- Convolution involves rotating the kernel/filter by  $180^\circ$  (flip rows and then flip columns), slide the kernel and compute SOP

$$H * I(x, y) = \sum_{i=-N}^N \sum_{j=-N}^N H(i, j) \cdot I(x - i, y - j) \quad \begin{bmatrix} 9 & 8 & 7 \\ 6 & 5 & 4 \\ 3 & 2 & 1 \end{bmatrix}$$

---

Convolution establishes link between operations in the frequency domain and the effect of spatial filters

# Image Enhancement in Frequency Domain – Preliminary Concepts

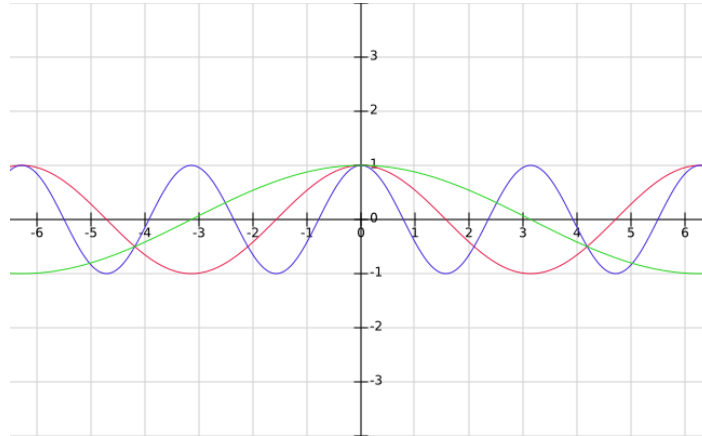

# Periodic Signals

- Periodic  $\rightarrow$  **Frequency** of occurrence
  - Repetitions/<Unit> (**cycles**/sec = Hz)

# Simple periodic signals

- $x(t) = A \cos(t)$
- $x(t) = A \cos(2t)$
- $x(t) = A \cos(t/2)$

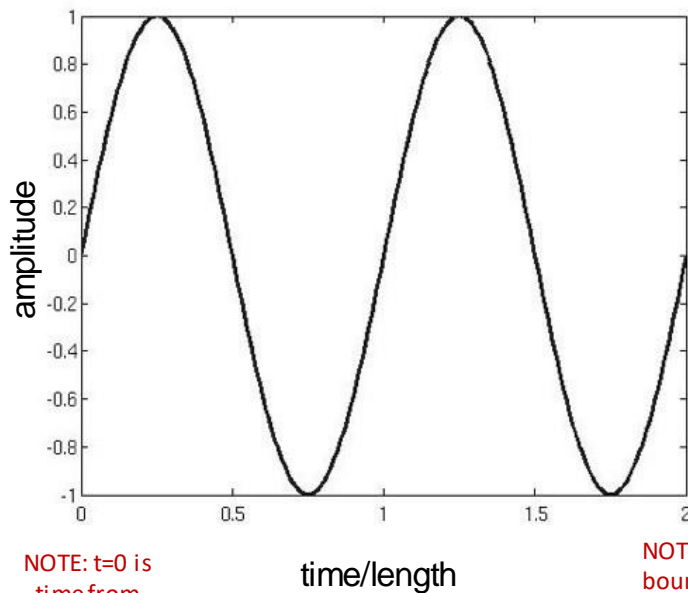

- $x(t) = A \cos(\omega t) = A \cos(2\pi f t) = A \cos\left(\frac{2\pi}{T} t\right)$

Angular frequency

# Signal and Frequency Domains

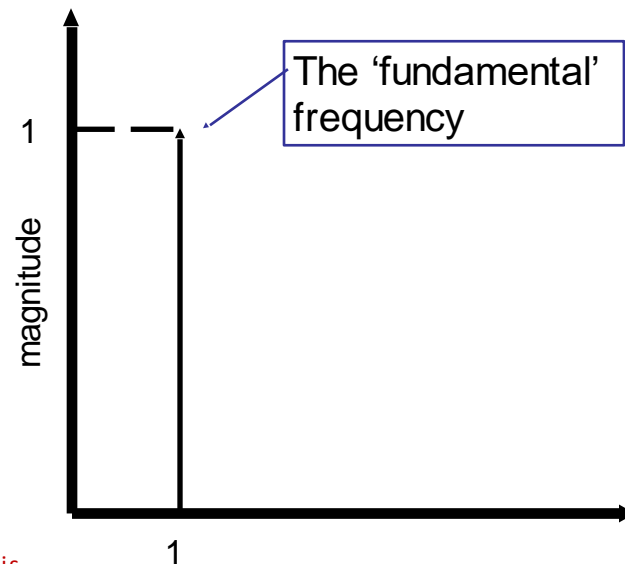

$$y = \sin(2\pi t)$$

NOTE:  $t=0$  is  
time from  
where signal is  
considered

**Signal domain**

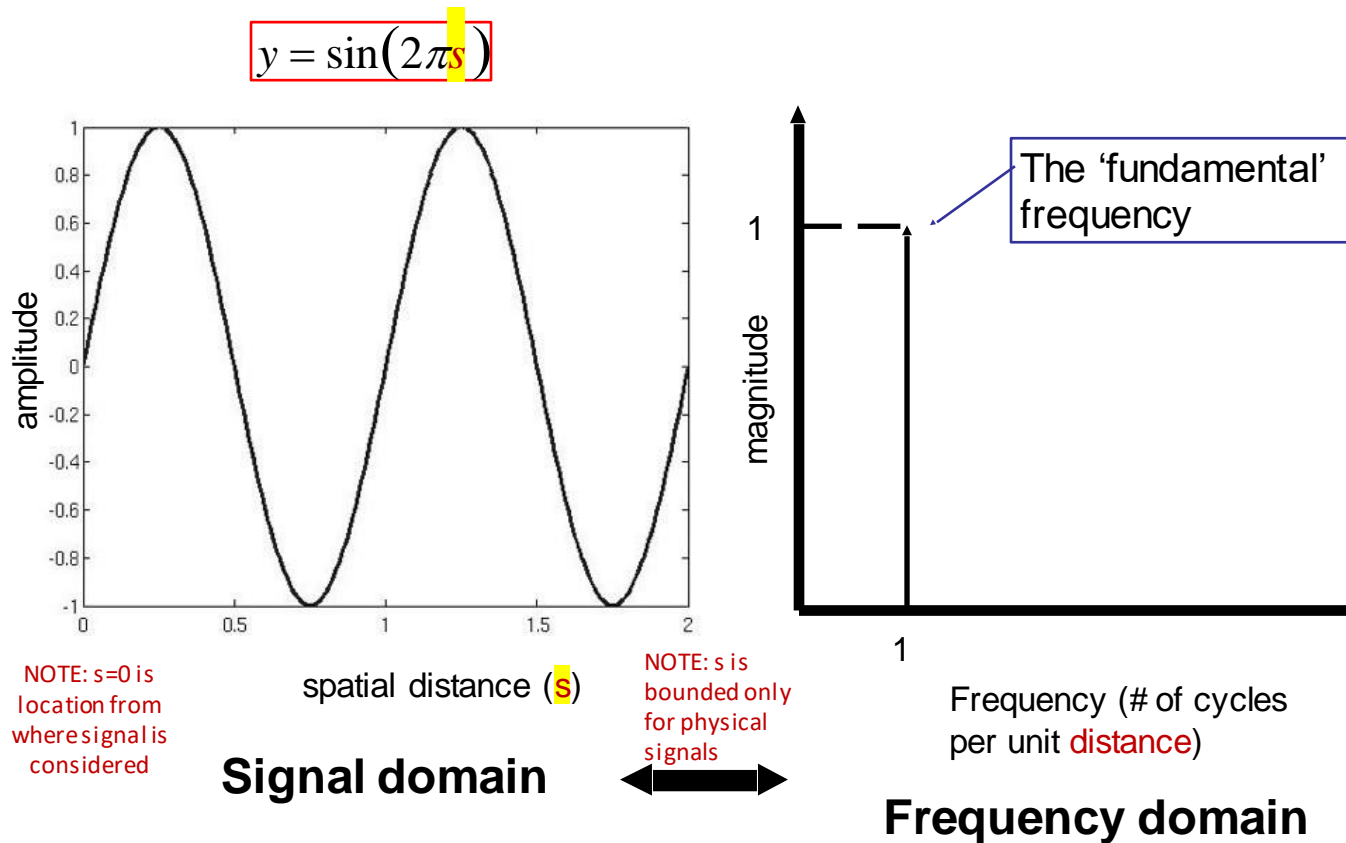

NOTE:  $t$  is  
bounded only  
for physical  
signals

Frequency (# of 'cycles'  
per unit **time**)

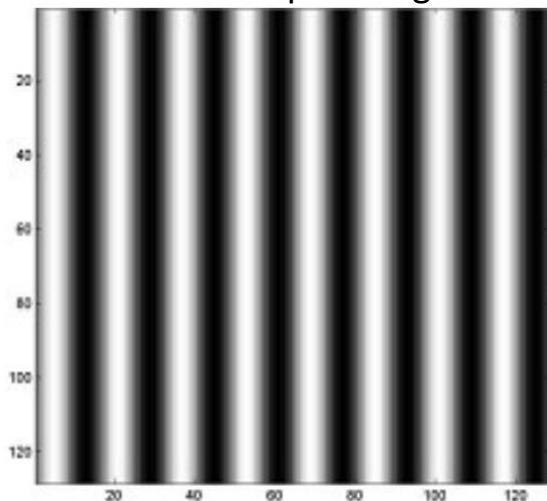

**Frequency domain**

# Signal and Frequency Domains

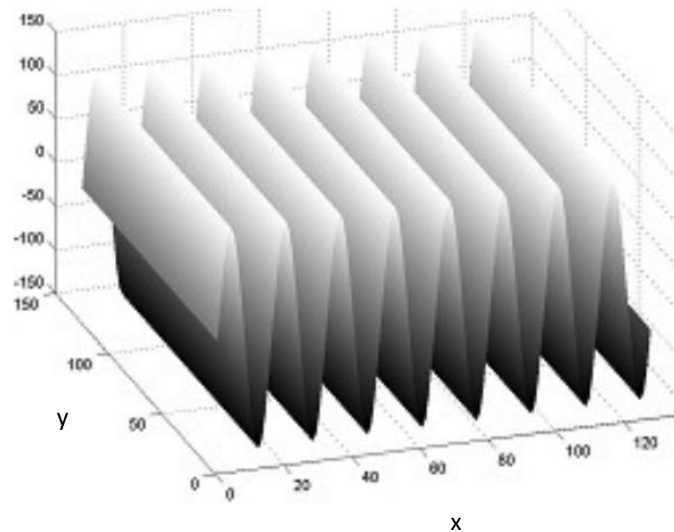

# Periodic Images

128 x 128 spatial signal

Sinusoid pattern repeats every 16 pixels  
 $f = 1/16$  cycles/pixel

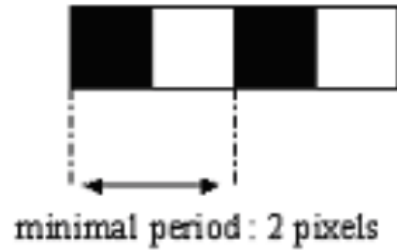

$$I(x, y) = 128 \sin(2\pi x/16)$$

# Periodic Images

Spatial period = Minimal # of pixels between two identical patterns in a “periodic” image

$\Rightarrow$

$$v_{\max} = \frac{1}{\text{minimal period}} = \frac{1}{2}$$
